AMENDMENTS TO THE CLAIMS

The following listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Cancelled)
2. (Previously amended) The system of claim 3, wherein core application functionality is preserved between the client and the server.
3. (Previously amended) A system that executes a network-based application, comprising
a first component that receives and maps a local request that is serviced by relevant portions of application logic stored on a local storage medium and a server, the relevant portions on the server comprising a mobile logic portion; and
a second component that identifies the relevant portions of the application logic and downloads the relevant portions from the local storage medium and server to the client to service the local request.
4. (Previously amended) The system of claim 3, wherein the local storage medium comprises a CD or floppy disk.
5. (Previously amended) The system of claim 3, wherein the first component comprises unguarded logic for lower security systems.
6. (Previously amended) The system of claim 3, wherein remote data is downloaded from the server to the client based upon a remote data request.
7. (Previously amended) The system of claim 6, wherein the remote data request is an HTTP request.

MS146917.2

-
8. (Previously amended) The system of claim 6, wherein the remote data is processed locally on the client *via* local data requests directed at the application logic.
9. (Previously amended) The system of claim 6, wherein the remote data is provided by at least one of an XML and WML response.
10. (Previously amended) The system of claim 6, wherein the remote data is communicated *via* at least one of the Internet, Intranet, or wireless networks.
11. (Previously amended) An architecture for processing networked-based applications, comprising:
- a presentation tier for interacting with a networked-based application at a client that is loaded *via* local storage and a server;
 - a mobile tier operatively coupled to the presentation tier, the mobile tier providing for executing at least a portion of the networked-based application that is mapped to local requests at the client end; and
 - a guarded tier operatively coupled to at least one of the mobile tier and presentation tier, the guarded tier providing for executing remaining portions of the network-based application at the server.
12. (Original) The architecture of claim 11, further including a data tier operatively coupled to the guarded tier, the data tier including data employed in connection with executing the network-based application.
13. (Original) The architecture of claim 11, wherein the guarded tier includes logic for enabling the mobile tier to execute the network-based application.
14. (Original) The architecture of claim 12, wherein the presentation tier generates local requests to the mobile tier to manipulate data provided by the data tier.

09/666,246

MS146917.2

-
15. (Original) The architecture of claim 14, wherein the mobile tier executes applications logic associated with the guarded tier to manipulate data provided by the data tier.
16. (Original) The architecture of claim 15, wherein the mobile tier processes local data requests offline and generates remote requests to the guarded tier to at least one of transmit and receive data associated with the data tier based upon the offline local requests.
17. (Original) A computer-readable medium having computer-executable instructions for providing the architecture of claim 16.
18. (Previously amended) A system for processing networked-based applications, comprising:
means for interacting with a networked-based application at a client; and
means for executing at least a portion of the networked-based application at the client end in connection with locally mapped requests and at a server in connection with remote requests, wherein the requests are generated by the client.
19. The system of claim 18, further comprising means for supplying remote data employed in connection with executing local data requests associated with the network-based application.
20. The system of claim 19, further comprising means for requesting the local data requests offline and generating remote requests to at least one of transmit and receive data associated with the remote data based upon the offline local requests.
21. (Previously amended) A method for executing a network-based application, comprising: executing at least a portion of a network-based application that is mapped to a local request on a client computer, the at least a portion of the network-based application comprising application and presentation logic loaded from local memory and a server, and executing at least a portion of network-based application which is interchangeably processed by a the server or the client without modification to the portion.

MS146917.2

-
22. (Currently Amended) A method that facilitates client-side computing, comprising:
transmitting a request for portions of an application associated with a transaction;
concurrently retrieving the respective portions of the application from a local and a
remote storage medium; and
executing the portions of the application in connection with the transaction.
23. (Original) The method of claim 22, further comprising mapping the retrieved portions of
application to the request.
24. (Original) The method of claim 22, further comprising commencing execution of the
transaction and associated portions of application on the client while off-line and completing the
transaction after re-connecting on-line.
25. (Currently Amended) A method that facilitates servicing a client request, comprising:
receiving a first request from ~~the~~ a client for a first portion of an application that is not
locally available to the client; ~~and~~
downloading the first portion of application to the client;
receiving a second request from the client to execute a second portion of the application
at the server to complete servicing the client request, wherein the request is satisfied by both the
client and the server that are concurrently servicing respective portions of the request.
26. (Cancelled)
